AI AUTOMATION CONSULTING PROJECT

Designing an AI-enabled and productized service model for a boutique consulting LLC

Purdue University
Corporate Consulting

A boutique operations and supply chain consulting LLC needed a way to grow without adding to the founder's workload. The engagement centered on one core question: which services could be productized, where could AI reduce delivery effort, and what could launch now.

EVALUATION FRAMEWORK

Services were scored against six weighted criteria. AI integration and scalability carried a combined weight of 45%, reflecting the core goal of reducing founder dependency.

Criteria	Weight	Priority
AI integration potential	**25%**	**Top priority**
Scalability / low founder dependency	**20%**	**Top priority**
Expertise fit	**15%**	
Standardizability	**15%**	
Market demand	**15%**	
Revenue potential	**10%**	

INTEGRATED GROWTH MODEL

The scoring matrix surfaced a clear three-layer service architecture. Each stage deepens the client relationship while reducing acquisition effort over time.

01 / ENTRY	02 / EXECUTION	03 / RETAINER
Diagnostics	**Fixed scope sprints**	**Recurring advisory**
AI-enabled, website-based. Low cost, high volume. Standardized input to output in under 48 hours.	High-impact engagements converting diagnostic findings into measurable financial outcomes.	Ongoing governance cadence. Recurring revenue with sustained client engagement.

KEY OUTCOMES

New client acquisition

The LLM workflow automation recommendation directly contributed to a new client, demonstrating measurable revenue impact.

60-80% automation potential

Identified across the prioritized service portfolio through structured AI capability mapping.

Service scoring matrix

Built from scratch to evaluate 10 plus services across six weighted criteria for AI readiness and scalability.

Full tech architecture

Designed for scalable, founder-light delivery using AI as the intelligence layer across the entire service stack.

Client name confidential. All recommendations were grounded in structured analysis including market evidence, input-output feasibility assessment, and AI capability mapping.
